

Proficiency Anchors

Define what “proficient” means together — before students have produced any work.

You can't calibrate scoring until students have taken an assessment. What you can do now is agree on what proficient looks like. Each teacher writes anchors for one key learning target; then the team compares them, names the disagreements, and refines the success criteria. The disagreements are the point — that's where a shared definition gets built.

1. Choose one key learning target

Learning target	
------------------------	--

2. Write your anchors (each teacher writes independently first, then share)

A proficient response looks like...	A not-yet-proficient response looks like...

3. Where did we disagree?

Put the anchors side by side. Where do we disagree about whether a response is “there yet”? Name it — that's the work.

4. Refine the success criteria

Rewrite your success criteria so they capture what the team agreed proficiency means — in specific, observable language.

Keep this. When students take the common assessment, these anchors and criteria are what you'll calibrate real scoring against.
